[PDF]

We propose two fast algorithms for the Prize-Collecting Steiner Tree Problem: the first one is a quasilinear-time heuristic algorithm that is faster and consumes less memory than the other algorithms; and the second one is an improvement of a state-of-the-art polynomial-time approximation algorithm that can produce near-optimal solutions at a speed that is only inferior to the first one. We demonstrate the competitiveness of our algorithms by comparing them with the state-of-the-art ones in large graphs with up to 1,000,000 vertices and 10,000,000 edges. We also propose some post-processing techniques to update the best-known solution for a notoriously difficult benchmark instance.

[PDF]

We propose the node-weighted Steiner tree approach to identifying important elements of cancer-related signaling pathways at the level of proteins. We apply this approach to identify important elements of two well-known cancer-related signaling pathways: PI3K/Akt and MAPK. On a commonly used personal computer, this new approach takes less than 2s to identify the important elements of PI3K/Akt and MAPK signaling pathways in a large node-weighted protein-protein interaction network with 16,843 vertices and 1,736,922 edges.
